Complete Offboarding Workflow

Version 1.0 · Revised October 16, 2026

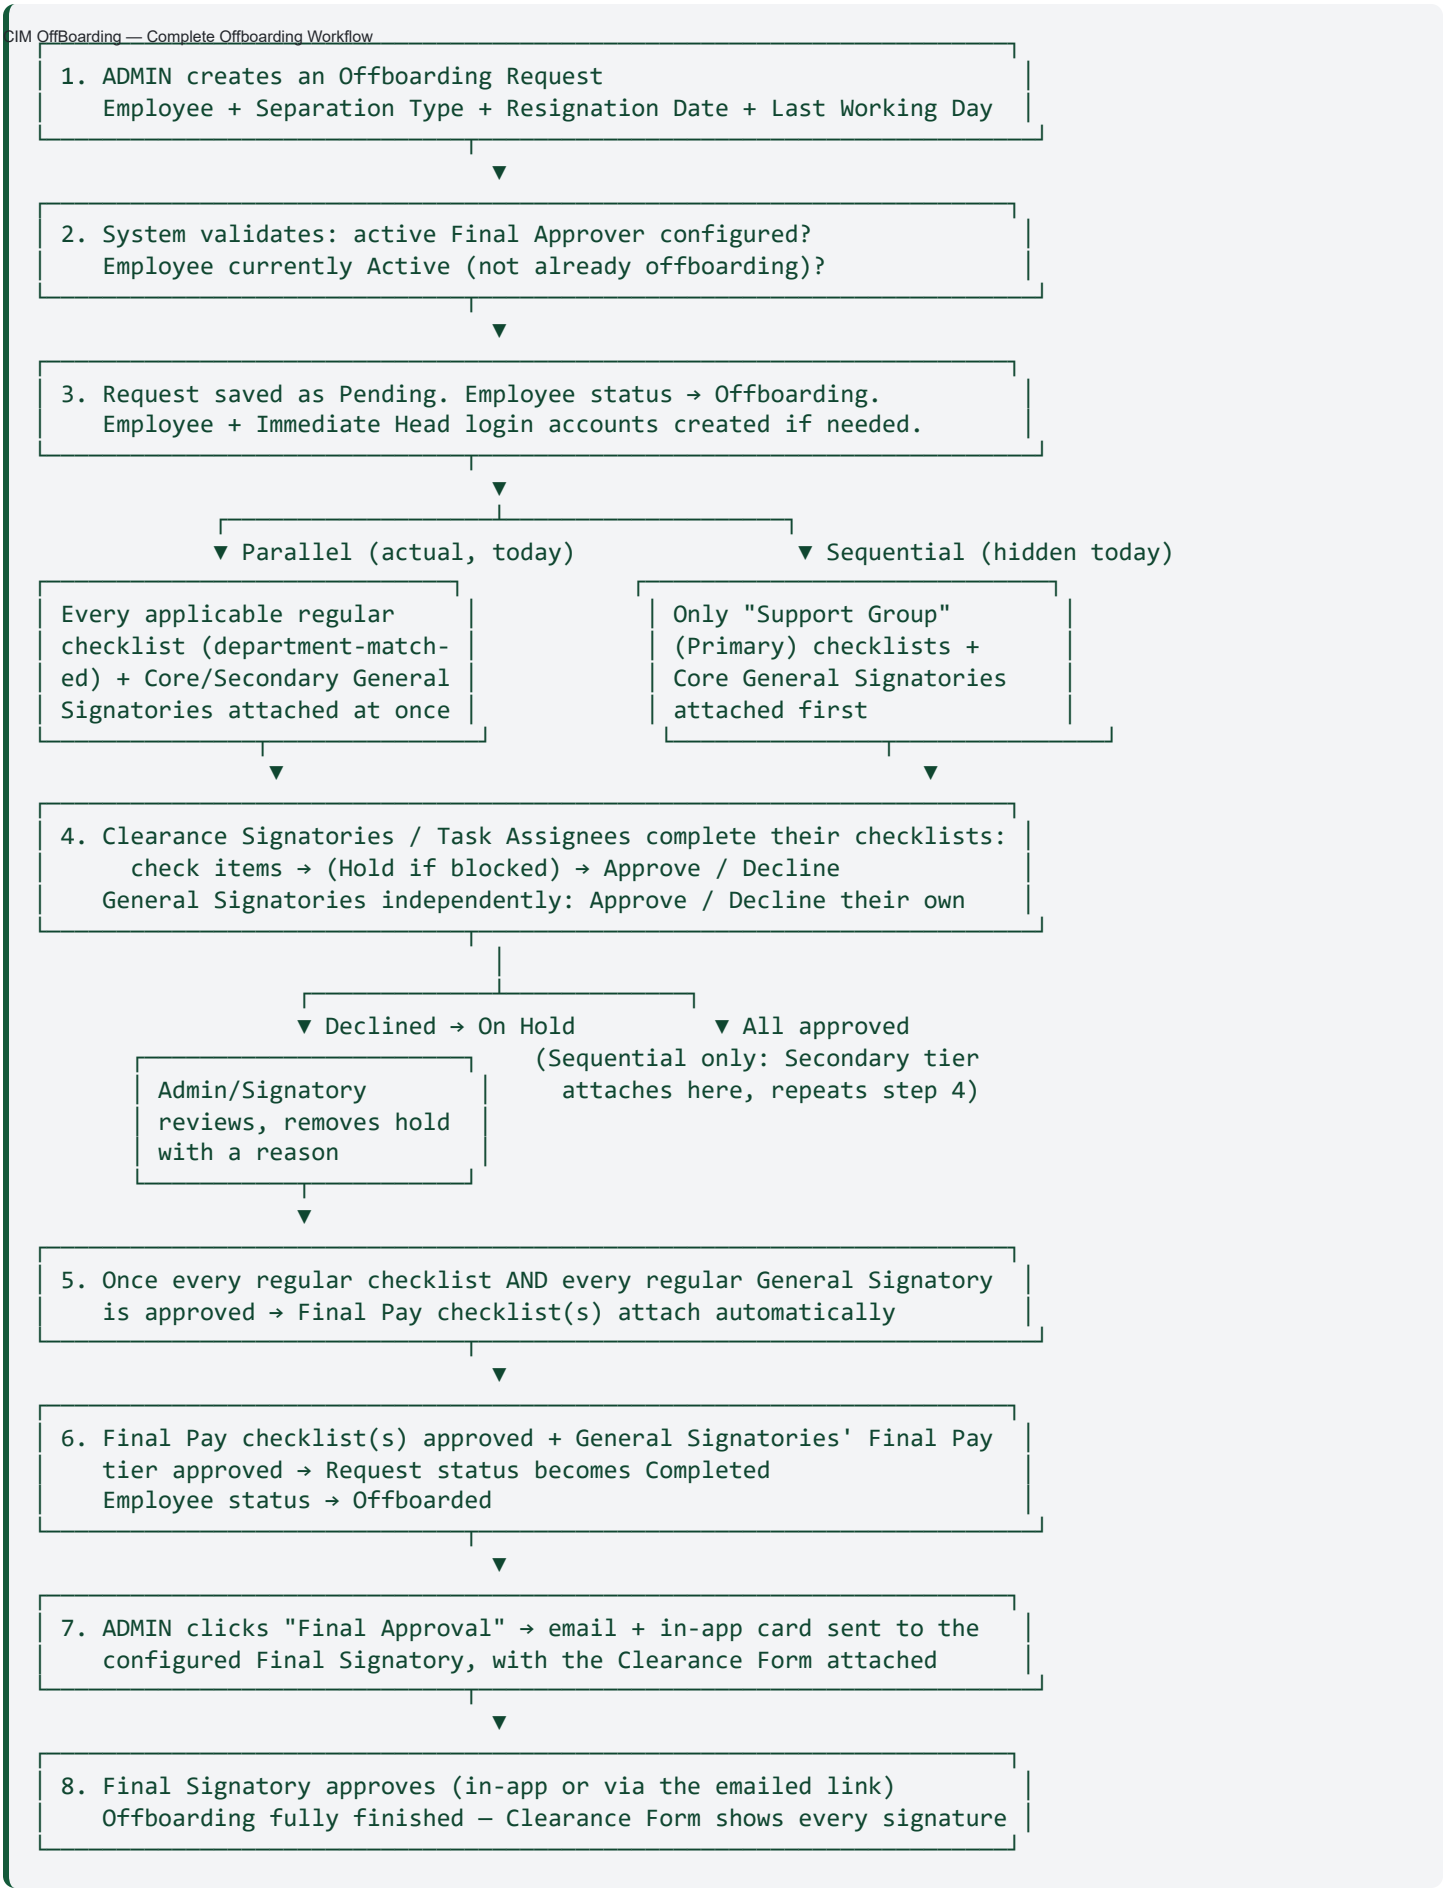

CIM OffBoarding — Complete Offboarding Workflow

Version: 1.0 | **Revision date:** October 16, 2026

This document traces one offboarding request from creation through to Final Approval, exactly as the application actually executes it — including branches that only happen under certain configurations. It is the diagram-first companion to `admin-user-manual.md`'s §3; every step below is explained there in full procedural detail (exact button labels, fields, and validation rules).

> **Important:** every request created today runs in **Parallel (Async) mode.** A **Sequential (Sync)** mode exists in the application's underlying logic — described below for completeness — but the control for selecting it on the New Offboarding Request form is currently hidden from the interface, so it cannot actually be chosen today.

Workflow diagram

(Retract and Extend Last Working Day — available at almost any point before completion — are summarized in the table just below the diagram.)

The 8 steps, with decision points and exception paths

1 — Create the request

An Admin selects an active employee, a Separation Type, an Immediate Head (auto-suggested), a Resignation Date, and a Last Working Day. See `admin-user-manual.md` §3, Step 2 for every field and validation rule.

2 — Validation gate

Two hard preconditions are checked before anything is saved: an **active Final Approver must already be configured somewhere in the system**, and the selected employee must currently be **Active** (not already mid-offboarding). Failing either blocks creation with a specific error message.

3 — Request created, accounts provisioned

Status becomes **Pending**, the employee's own status becomes **Offboarding**, and login accounts are auto-created (if missing) for the employee and the Immediate Head.

4 — Checklist/signatory attachment and completion (the decision point that actually matters)

This is where **Parallel vs. Sequential** genuinely changes behavior — though only Parallel is reachable from the UI today:

- **Parallel (actual):** every applicable regular checklist, plus the General Signatories' Core and Secondary tiers, attach simultaneously. Nobody waits on anybody else to start.
- **Sequential (hidden):** only Primary ("Support Group") checklists and Core General Signatories attach first; Secondary checklists and the Secondary General Signatory tier wait until every Primary item is approved, then attach and repeat this same step.

Within this step, each signatory works through: check items → optionally place an item or the whole checklist **On Hold** if blocked → **Approve** (or **Decline**, which is the same underlying action as placing the whole checklist On Hold). See `admin-user-manual.md` §3, Step 5 for the exact mechanics.

Exception branch: a declined/on-hold checklist pauses only itself — every other checklist on the request continues independently. An Admin or that checklist's own Clearance Signatory removes the hold (with a reason) to resume it.

5 — Final Pay checklists attach

Triggered automatically, the instant **every** regular checklist and **every** regular (non-Final-Pay) General Signatory is approved.

6 — Completion

Triggered automatically, the instant every Final Pay checklist **and** the General Signatories' own Final Pay tier is approved. Status → **Completed**, employee status → **Offboarded**.

7 — Final Approval sent

A manual Admin action — clicking **"Final Approval"** on the Offboardee page — only possible once step 6 has happened. Emails and in-app-notifies the configured Final Signatory, with the Clearance Form attached.

8 — Final Approval given

The Final Signatory approves either inside the application or via the emailed link — both are always available, there is no "email-only" restriction. This is the true end of the process.

Branches available at nearly any earlier point

Action	When it's available	Effect
Retract	Last Working Day hasn't passed **and** no checklist has been approved yet	Permanently closes the request as a read-only record (nothing deleted); employee reverts to Active.
Extend Last Working Day	At least one checklist is still pending with a due date (does not need to be overdue)	Moves the Last Working Day forward only; every pending checklist's due date recalculates automatically.

For every exact button label, validation message, and field involved in each of these 8 steps, see the corresponding section of `admin-user-manual.md`, particularly §3 ("The complete offboarding process, step by step").
